

SNF – *Energy Management Policy*

SNF FLOERGER®

Energy Management Policy

SNF's energy expenditures (electricity and gas) have risen from 5.7 M€ to 10 M€ between 2003 and 2007. During these times of energy and economic crisis and in order to provide a sustainable development to our activities, we must react by reducing our energy consumption.

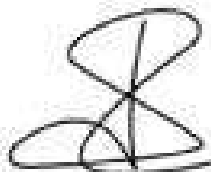

An energy diagnosis has revealed possible savings that would allow a 10% reduction of our consumption at equal production rate. **This represents a savings of 1 million euros.**

This reduction in our energy consumption can mostly be achieved by implementing simple work organisation measures, new workshop week-end shut-down procedures and a better management of the heating of buildings.

Most of the measures recommended by the energy diagnosis do not require an important investment. In fact, most of them are just good sense. These measures will allow us to make energy savings and reduce our environmental footprint.

An Energy Management Team has been created **to implement in practical terms** this action plan that aims to lower our energy consumption.
